

D and L Ascorbic acid Separation Analyzed by HPLC- AppNote

An Analysis of Vitamin C

Click <u>HERE</u> for Column Ordering Information.

This simple Method shows good separation between two Enantiomers as well as Retention, considering these Acids both have a - 1.6 log p. This Method is Robust as results were verified with three different HPLCs and two separate Columns, all showing excellent Resolution of these two Acids.

Peaks:

1. D- Isoascorbic acid

2. L- Ascorbic acid

Method Conditions

Column: Cogent Diamond Hydride™, 4µm, 100Å

Catalog No.: <u>70000-10P</u>

Dimensions: 4.6mm x 100mm

Mobile Phase: 98% Acetonitrile 2% DI Water / 0.1% Formic Acid

Flow Rate: 1.0mL / minute Injection Volume: 1uL Detection: UV 254nm Injection vol.: 1µL

Sample Preparation: D- Isoascorbic Acid and L- Ascorbic Acid in 1.0 mg/mL in diluent of 50%

Acetonitrile / 50% DI Water (v/v)

t0: 1.20 Minutes

K1: 0.39 **K2:** 0.62

α: 1.59

Note: Ascorbic acid exists as two enantiomers (mirror-image isomers), commonly denoted "I" (for "levo") and "d" (for "dextro"). The I isomer is the one most often encountered and occurs naturally in many foods, and is one form of Vitamin C, an essential nutrient for many animals. Deficiency of Vitamin C causes scurvy. Vitamin C is used as a food additive and a dietary supplement for its antioxidant properties. The "d" form can be made via chemical synthesis but has no significant biological role.

Capacity Factor - Relative Retention k = (tR-t0)/t0 $\alpha = K2/K1$
