

## Anatoxin-a Analyzed with LCMS - AppNote

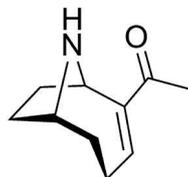

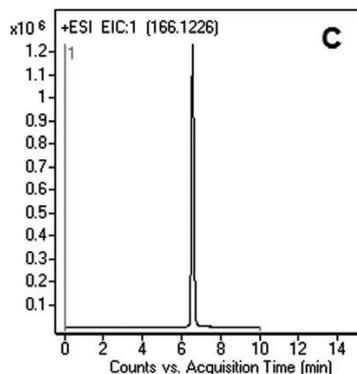

### Anatoxin-a Analyzed with LCMS

Figures below illustrate an example of the work flow in developing a Method for the Analysis of a Polar Compound using Cogent Diamond Hydride™ Columns and the impact of Aqueous Normal Phase HPLC.

The simplified steps of Method Development are as follows:

- **A.** Injection of the Sample at 50:50 Solvent A / Solvent B Isocratic Mobile Phase Composition results in *Figure A*. In this case, Anatoxin-a has considerable retention.
- **B.** Injection of the Sample at 40:60 Solvent A / Solvent B Isocratic Mobile Phase Composition results in *Figure B*. As expected, the Retention of Anatoxin-a is longer and the Peak Shape is broader with higher organic content.
- **C.** Based on the above results, a simple Linear Gradient is designed to achieve the desired Retention of the Compound and excellent Peak Shape (*Figure C*). If shorter Retention time is desired it can be accomplished by changing the starting concentration of Solvent B to 60%, designing a steeper gradient, or using a shorter Column such as 2.1 x 50 mm.

**Peak:**

Anatoxin-a, 166.1226 m/z (M+H)<sup>+</sup>

**Method Conditions**

**Column:** Cogent Diamond Hydride™, 4 μm, 100 Å

**Catalog No.:** [70000-15P-2](#)

**Dimensions:** 2.1 x 150 mm

**Mobile Phase:**

A: 50% Methanol / 50% DI Water / 0.1% Formic Acid

B: Acetonitrile / 0.1% Formic Acid

**Gradient:**

Time (minutes)	%B
0	70
5	30
6	30
7	70

**Temperature:** 25°C

**Post time:** 5 minutes

**Injection vol.:** 1 μL

**Flow rate:** 0.4 mL / minute

**Detection:** ESI – POS - Agilent 6210 MSD TOF Mass Spectrometer

**t<sub>0</sub> :** 0.9 minutes

**Note:** Anatoxin-a (ANTX-A) is a cyanobacterial neurotoxin, implicated in many animal and human poisoning incidents. ANTX-A blocks neurotransmission causing death by respiratory arrest. The presence of this toxin in freshwater has to be monitored in order to prevent fatalities.
